

Inventions that make our life easier

I was born at the beginning of the 21st century. The 21st century is the world of new opportunities, new discoveries, the age of information technology. Before writing an essay, I also used one of these inventions, humanity, a computer. Studying the topic of inventions that make our lives easier, I discovered a lot for myself. Firstly, this is already a forgotten invention for me the great Heron of Alexandria. For his time, carried away by science, he invented amazing inventions. I learned that, fortunately, copies of his works are stored in one of the largest repositories of knowledge in the library of the University of Oxford. I was struck by the fact that in his works there is some kind of magic, which had a scientific explanation. The ancient world left a huge legacy after itself, philosophy, mathematics, democracy. Now let's talk about the modern invention, which made our life more interesting. We live in an unique time to fly around the floor of the Earth, it only takes half a day. But if you recall our origins, nomads, then we recall a lot of camels carrying cargo, including carrying people. Now, as a resident of this century, I can't even imagine how they determined the routes, how they determined the border and generally geography. But that generation has progressed so much that we can afford to travel, get acquainted with the culture of other countries. Today, the plane is no longer something unusual, it is public transport.

If we recall that it was invented in the middle of the 18th century, comparing the first and today's models, I think at the end of the 21st century, airplanes will be in our garages. We are now using the fruits, perhaps at that time, the generation could only dream of such a transport, and we divide it into business classes and economy classes. Many thanks to the inventors of this type of transport, which allowed us to move from one country to another with such comfort. Having finished my studies and becoming a sought-after specialist, I think I fly more than once. And today my plans are included, I just dream of traveling. As I wrote above, I definitely want to visit the repository of knowledge at the University of Oxford library, and read the works of great inventors.

Since the beginning of the 20th century, new technologies began to appear in the world. Thanks to cell phones, we can communicate, communicate with each other, while being on different continents of the planet. Using this miracle of technology, being on different sides of the planet, we can make audio-video calls. To support a person close to us in different periods of his life. During this time, pigeons brought millions of letters, saved thousands of people, completed dozens of feats. A trained bird would return home, even if taken away for a considerable distance in a state of deep anesthesia. Egyptian and Greek sailors from the 16th century BC e. reported home about their arrival. Pigeons can cover significant distances. And although it is believed that a pigeon can not fly more than 1,100 kilometers, there is evidence of some champions covering and much greater distances. Dove on average fly at a speed of 80-100 kilometers per hour, i.e. faster

than train. On their own, they are able to carry loads of a third of their own weight, namely - about 80–90 grams.

The washing machine is the undisputed leader among inventions that made life easier. From constant washing by hands, where not a small amount of detergents were used, which were not always harmless, the skin cracked, sores, and if there is still an allergy to any components in the detergent in general, nothing nice. I will introduce our grandmothers who used an inclined ribbed board to wash voluminous things. so immediately many times thank people who invented the washing machine. The breakthrough came about only in 1851, when the United States came up with a mechanical washer. Half a century later, the first model with an electric drive appeared, and already in 1949 - a full-fledged automatic machine.

I can not help but note the refrigerator. I have a great-grandmother who is 97 years old, she says that they had to save food underground. They had to dry and dry foods. Dried berries and vegetables. The meat and fish were thinly sliced, salted and kept in a draft - this way the food was stored for several months. Since there is no practice, I can't even imagine it, because comfort has done its job. Now this is one of the first household devices that appears in a new house. Otherwise, all family trips to the supermarket once a week with a kilometer list simply lose their meaning. You'll have to go to the shops and the market every day, buy a little so that the products do not deteriorate

For centuries, it has been women who have been cleaning the house. Well at least the vacuum cleaner was invented. It was first introduced in 1901, it worked on a gasoline engine and moved through the streets. Carpets were carried out for him. Now the dimensions have decreased significantly, there are models that not only collect dust, but also wash the floors. Last squeak - robotic vacuum cleaners. This option is generally ideal, but the technology has not yet been fully developed. It remains to be expected when artificial intelligence will master the cleaning process well.

Of course, it is impossible not to mention a microwave oven, it defrosts, warms, cooks - and does it all much faster than a conventional stove or oven. Truly appreciated the virtues of the miracle stove, when the rhythm of life in the cities began to gain momentum, a modern woman, as my mother says, must do everything, and this microwave oven is not an irreplaceable invention for the kitchen. and most importantly, our children are not afraid to use it, especially when mom forgot to cook dinner for us, all that is needed is to warm bread with cheese, and good, tasty food is ready in a matter of minutes. If you continue the list of inventions that made life easier, this list can be continued indefinitely, for example, an iron, a laptop, a radio, lamps, a battery, a hot butter knife, food bags, plastics, a wi-fi handle, a folding electric scooter and of course the Internet etc.

What our previous generations just didn't go through, I don't want to write anymore, but the level of comfort in our life is quite high. I look at the older generation, inventions in the field of beauty, women can not imagine life without a helium coating of nails, and false eyelashes. And then I thought about how our grandmothers lived, because looking at their black and white photographs, it is clear that in those days women were well-groomed, neat styling, they themselves did

manicures and pedicures, etc., I got the impression. We inherited everything that the previous generations dreamed about, we have everything for a comfortable life, but at the same time we are lazy to use the same, vacuum cleaner, or the same gas stove, choosing fast foods. Sometimes I personally, and my peers find themselves captive to the Internet and computer smartphones. thereby degrading and not developing. But it's good that there are parents who set the right path, because these inventions should be used for the good, not only spend time stupidly on social networks, but it's not necessary to go to the libraries, you can use these benefits for your own good. After all, life is really easier with these inventions, and we must spend it brightly and interestingly, for the benefit of society. I thought about the fact that today we are present, after some times and our time will pass, the generation will grow after us, and what can we give them, can our generation give the same heritage? This is a huge responsibility. After all, life not only consists of easy ways, we must be able to preserve and value what we have, multiplying it.
